Cybersecurity Roadmap

Developer → Security

A free, hands-on, 12-month path from backend developer to application & cloud security.

OWASP | API | Docker | AWS | K8s | IaC

FREE

Don't just find bugs.

Learn to build and run systems that are:

Secure by default

Tested

Least-privilege

Monitored

Automatically checked

Recoverable

Audit-ready

That's what an application & cloud security engineer does. This roadmap trains exactly that.

By Ubong Eduok

Swipe →

Every week comes with:

1

A real-world scenario

Where it goes wrong in practice

2

Diagrams

The mechanism, drawn

3

A tested lab

Fix it, then prove the fix

4

A drill

With answers, to check yourself

3	12	20+	60+
Levels	Months	Labs	Drills

Plus a project at the end of every month.

Swipe →

The path 1/3 How it breaks

M1

Security foundations

Linux, networking, TLS, threat modeling

M2

Web app security

OWASP Top 10, SQLi, XSS, CSRF, sessions

M3

API security

Tenant isolation, JWT & OAuth, rate limits

M4

Advanced web

SSRF, file uploads, race conditions

By Ubong Eduok

Swipe →

The path 2/3 Prevent it

M5

Secure development

Code review, SAST, SCA, CI security gates

M6

Containers & hosts

Non-root Docker, image scanning, SBOMs

M7

Cloud foundations

AWS IAM, VPC, KMS encryption, CloudTrail

M8

Infrastructure as code

Terraform, OIDC, secrets, state

By Ubong Eduok

Swipe →

The path 3/3 Detect & ship

M9

Advanced cloud

Attack paths, posture audits, Kubernetes

M10

Detection & response

Logging, detection rules, incident response

M11

Security assessment

Test plans, findings, CVSS, retesting

M12

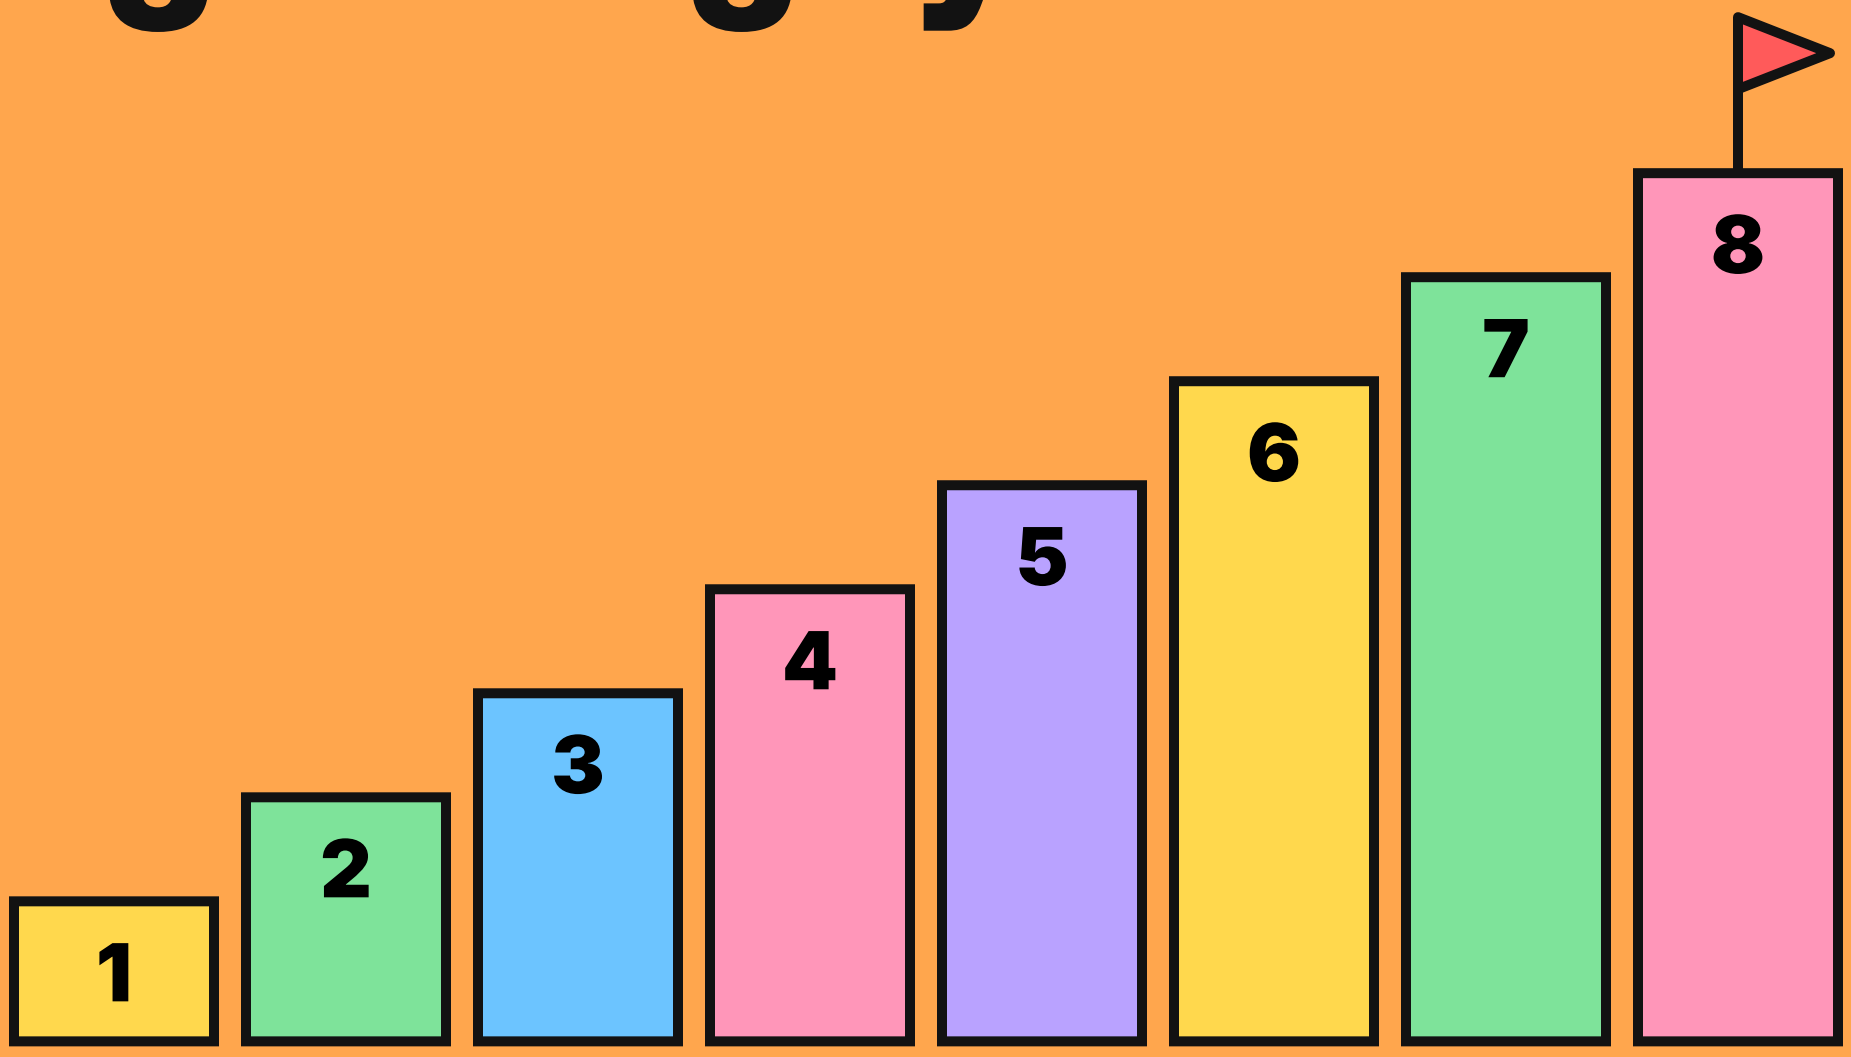

Capstone

One system, every control, evidence for each

By Ubong Eduok

Swipe →

8 portfolio pieces. 1 growing system.

1 Linux hardening
2 API security lab
3 Secure API template
4 Hardened containers
5 Secure IaC pipeline
6 Monitoring & IR
7 Full assessment
8 Capstone platform

By Ubong Eduok

Swipe →

How long does it take?

12 months

at 8–12 hours a week

Your pace

move on when you can show the skill

Each level ends with a checkpoint:

L1	After Month 4	≥ 80% + a practical task
L2	After Month 8	≥ 80% + a practical task
L3	After Month 12	≥ 80% + a practical task

A fix isn't done until a test proves it.

```
// Month 3 lab · who can see invoice #N?
['alice (Acme admin)', 'get',    2, 200],
['alice (Acme admin)', 'get',    3, 404], // other tenant
['bob (Acme member)',  'get',    1, 404], // colleague's
['bob (Acme member)',  'delete', 2, 403], // admin-only
['anonymous',          'get',    1, 401],
```

19 cases like these run against a real PostgreSQL database, on every push.
